

## Product Overview

### Description

System 77 is the most sophisticated, Windows®-based information management system available for consolidating company-wide mail processing information. It can connect up to 9,999 units depending on network capability.

The System 77 is easily assimilated to "the users world" because it employs existing software and communication structures. The System 77 will interface with many devices that handle paper: mail machines, copiers, bursters, inserters and more. It should find an application in virtually any accountable process.

Because the System 77 can be interfaced to a wide variety of equipment, you will not be tied to a single manufacturer. You can work with your existing equipment or choose equipment that's right for your specific application.

For postage accounting the System 77 permits chargeback information to be sent via network in a variety of formats including Word, Excel, Lotus, ODBC, ASCII and HTML for posting as an Intranet web page.

From your desktop you can search for and display your current jobs on-screen, with real-time data. The System 77 accounting terminal is an exclusive, full-color, touch-screen, Internet-ready, networkable PC.

## Product Overview

### Data-Management Features

- Designed for Windows® 2000 Professional (Standard)
- LAN/WAN, peer-to-peer networking
- Compatible with Novell Networks
- Touch-screen, graphical user interface
- Unlimited reporting capability
